

FLOW PILOTS

Mobile with Mono

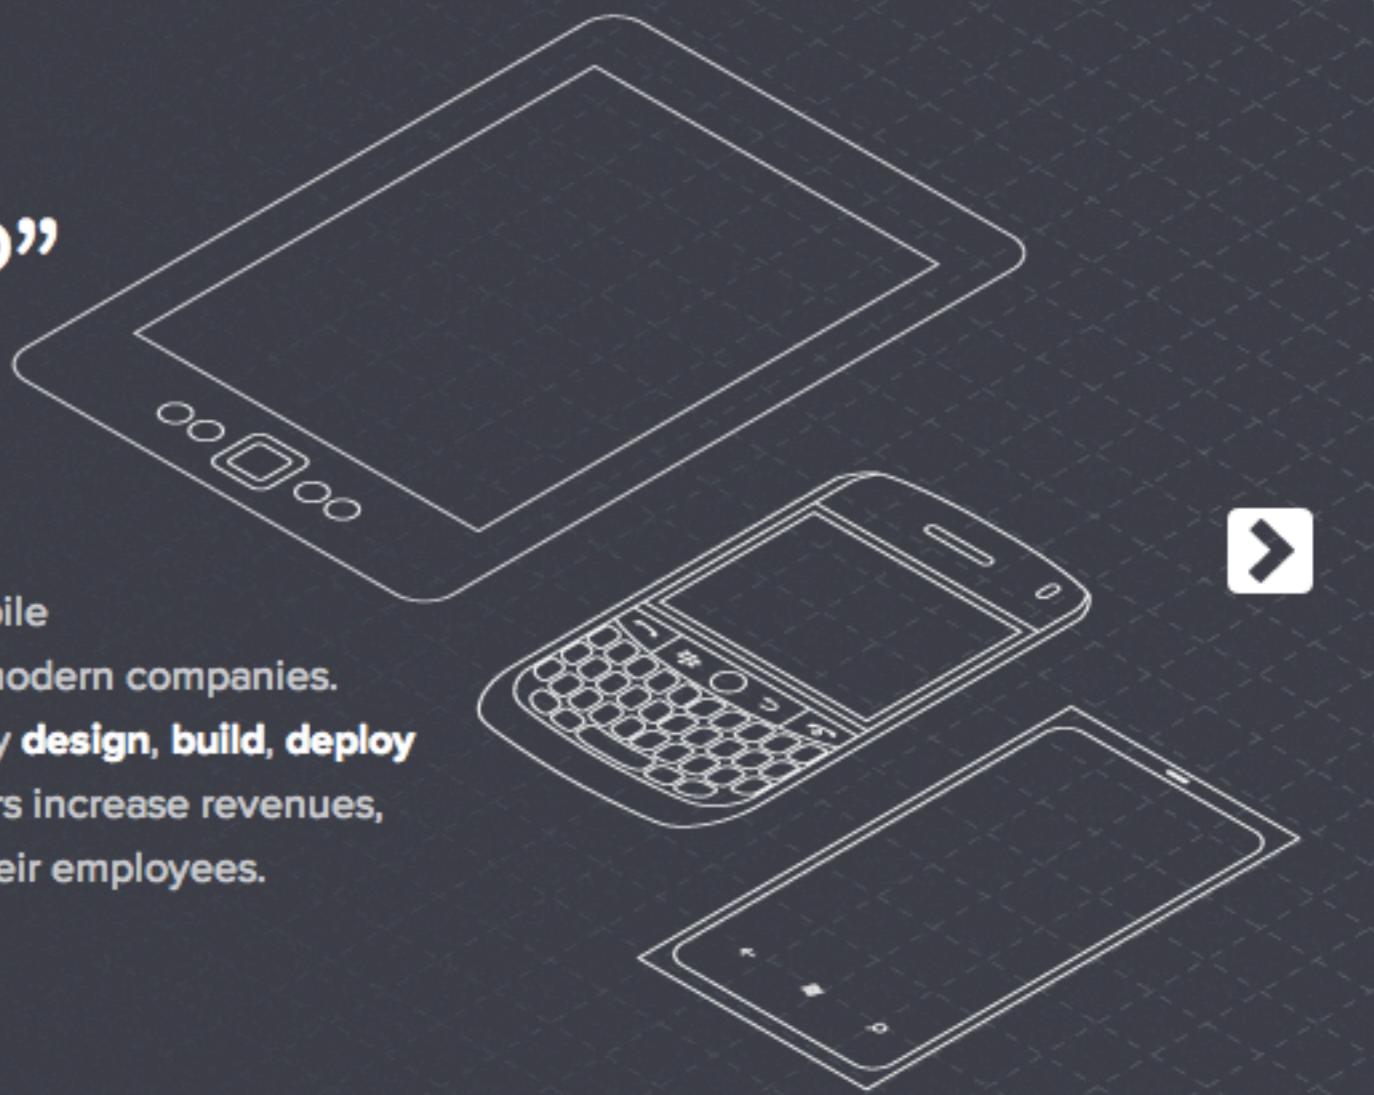

Ruben Vermeersch
@rubenv

FINALLY. A PROFESSIONAL PARTNER FOR YOUR CORPORATE MOBILE NEEDS.

“WE NEED AN APP” IS NOT A MOBILE STRATEGY

At Flow Pilots, we believe that the smart use of mobile technologies will be a key driver in the success of modern companies. That is why we don't just develop apps. We carefully **design, build, deploy** and **manage** the digital tools that help our customers increase revenues, decrease costs or bring freedom and flexibility to their employees.

Mobile apps on different platforms

State of the union

Three platforms, three technologies

Objective-C
Cocoa / UIKit

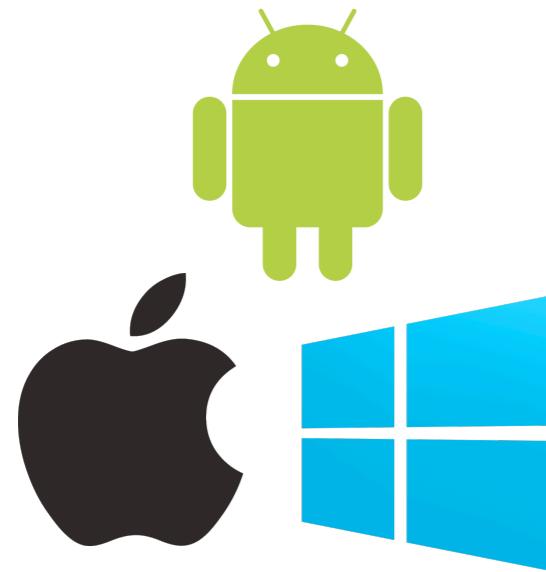

Java
Android SDK

C#
WinRT

Building on all platforms

Fully native

Loads of work

No reuse

Awesome

Hybrid

Web

No device APIs

Feels wrong

Code reuse

What is Xamarin.iOS?

.NET bindings to iOS APIs

- Plain C libraries and frameworks
- CoreFoundation based frameworks
- Objective-C based frameworks

What is it not?

- Not a UI toolkit!
- Not a platform abstraction!
- As a user, no way to tell the difference from 100% native

API bindings	Xamarin Studio	SDK
Bindings to the native APIs	IDE project support	Build tools
Mono Runtime Extensions to bridge .NET and Objective-C	Xcode designer integration	Packaging / Signing
iOS 4.0 and up	Project templates	Documentation

Some benefits

- One binding, multiple languages (most important: C#, soon: F#)
- Reuse C# across platforms
- Strongly typed APIs
 - Easy to explore
- Garbage collection everywhere
 - Both Foundation and CoreFoundation objects
 - Unlike ARC which is limited to NSObject
- Safe runtime, access to .NET class libraries and .NET ecosystem

Strongly typed APIs

- Foundation/CoreFoundation are weakly typed
 - Think C# 1.0 collections: ArrayList, Hashtable
- Mono exposes strong types:

```
UIView [] Views { get; set; }
```

vs.

```
(NSArray *) views;
```

Objective-C Sample

```
CIContext *context =
    [CIContext contextWithOptions:
        [NSDictionary dictionaryWithObject:[NSNumber numberWithBool:YES]
            forKey:kCIContextUseSoftwareRenderer]];
CIIImage *ciImage = [CIIImage initWithCGImage:cgImage];

CIFilter *hueAdjustFilter = [CIFilter filterWithName:@"CIHueAdjust"];
CIFilter *colorControlsFilter = [CIFilter filterWithName:@"CIColorControls"];

[hueAdjustFilter setValue:[NSNumber numberWithDouble:3.0 * M_PI] forKey:@"inputAngle"];

[colorControlsFilter setDefaults];
[colorControlsFilter setValue:[NSNumber numberWithDouble:1.3] forKey:@"inputSaturation"];
[colorControlsFilter setValue:[NSNumber numberWithDouble:0.3] forKey:@"inputBrightness"];

[hueAdjustFilter setValue:ciImage forKey:@"inputImage"];
[colorControlsFilter setValue:[hueAdjustFilter valueForKey:@"outputImage"] forKey:@"inputImage"];
ciImage = [colorControlsFilter valueForKey:@"outputImage"];

[context [createCGImage: ciImage fromExtent:[ciImage extent]]];
```

C# Version

```
var context = CIContext.FromOptions (new CIContextOptions () {
    UseSoftwareRenderer = true
});
var ciImage = new CIImage (cgImage);
var hueAdjustFilter = new CIHueAdjust {
    InputAngle = 3.0f * Math.PI,
    Image = ciImage,
};

var colorControlsFilter = new CIColorControls {
    InputSaturation = 1.3f,
    InputBrightness = 0.3f,
    Image = hueAdjustFilter.OutputImage
};

ciImage = colorControlsFilter.OutputImage;
context.CreateImage (ciImage, ciImage.Extent);
```

C APIs

CoreFoundation APIs

```
CFStringRef keys[] = {
    kCTFontAttributeName,
    kCTForegroundColorAttributeName
};

CFTypeRef bval[] = {
    cfListLineCTFontRef,
    CGColorGetConstantColor(kCGColorBlack)
};

attr = CFDictionaryCreate (kCFAlocatorDefault,
    (const void **) &keys, (const void **) &bval,
    sizeof(keys) / sizeof(keys[0]), &kCFTypeDictionaryKeyCallBacks,
    &kCFTypeDictionaryValueCallBacks);

astr = CFAttributedStringCreate(kCFAlocatorDefault, CFSTR("Hello World"), attr);
```

C APIs

CoreFoundation APIs

```
CFStringRef keys[] = {
    kCTFontAttributeName,
    kCTForegroundColorAttributeName
};

CFTypeRef bval[] = {
    cfListLineCTFontRef,
    CGColorGetConstantColor(kCGColorBlack)
};

attr = CFDictionaryCreate (kCFAlocatorDefault,
    (const void **) &keys, (const void **) &bval,
    sizeof(keys) / sizeof(keys[0]), &kCFTypeDictionaryKeyCallBacks,
    &kCFTypeDictionaryValueCallBacks);

astr = CFAttributedStringCreate(kCFAlocatorDefault, CFSTR("Hello World"), attr);

var attrs = new CFStringAttributes {
    Font = listLineCTFont,
    ForegroundColor = UIColor.Black.CGColor
};

var astr = new NSAttributedString ("Hello World", attrs);
```

C APIs

AudioToolbox

```
UInt32 maxPacketSize;
UInt32 PropertySize = sizeof(maxPacketSize);
AudioFileGetProperty (
    audioFileID,
    kAudioFilePropertyPacketSizeUpperBound,
    &PropertySize,
    &maxPacketSize
);
```

C APIs

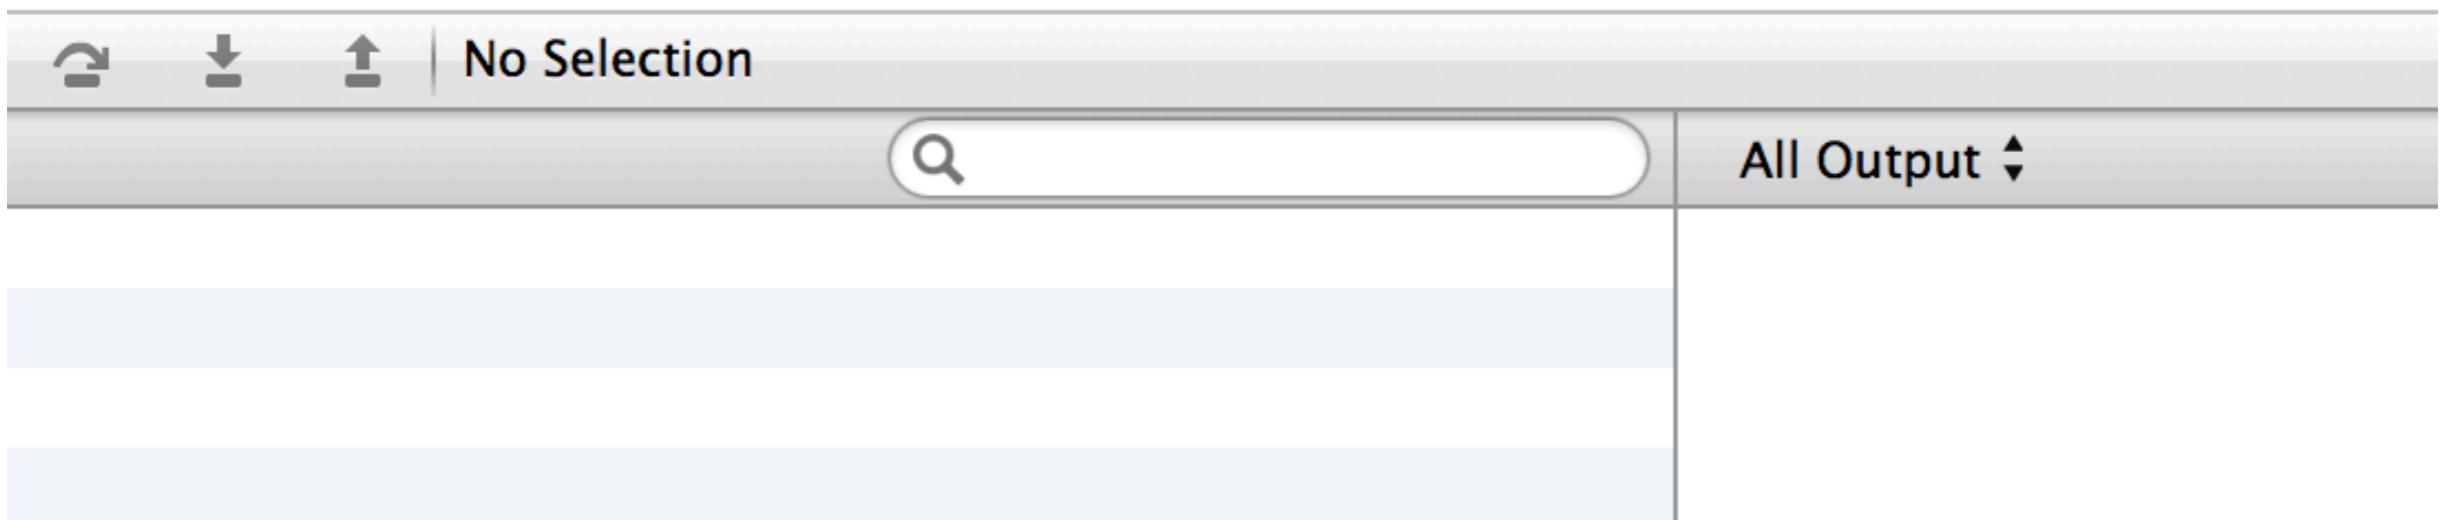

AudioToolbox

```
UInt32 maxPacketSize;
UInt32 PropertySize = sizeof(maxPacketSize);
AudioFileGetProperty (
    audioFileID,
    kAudioFilePropertyPacketSizeUpperBound,
    &PropertySize,
    &maxPacketSize
);
```

```
var maxPacketSize = audioFile.PacketSizeUpperBound;
```

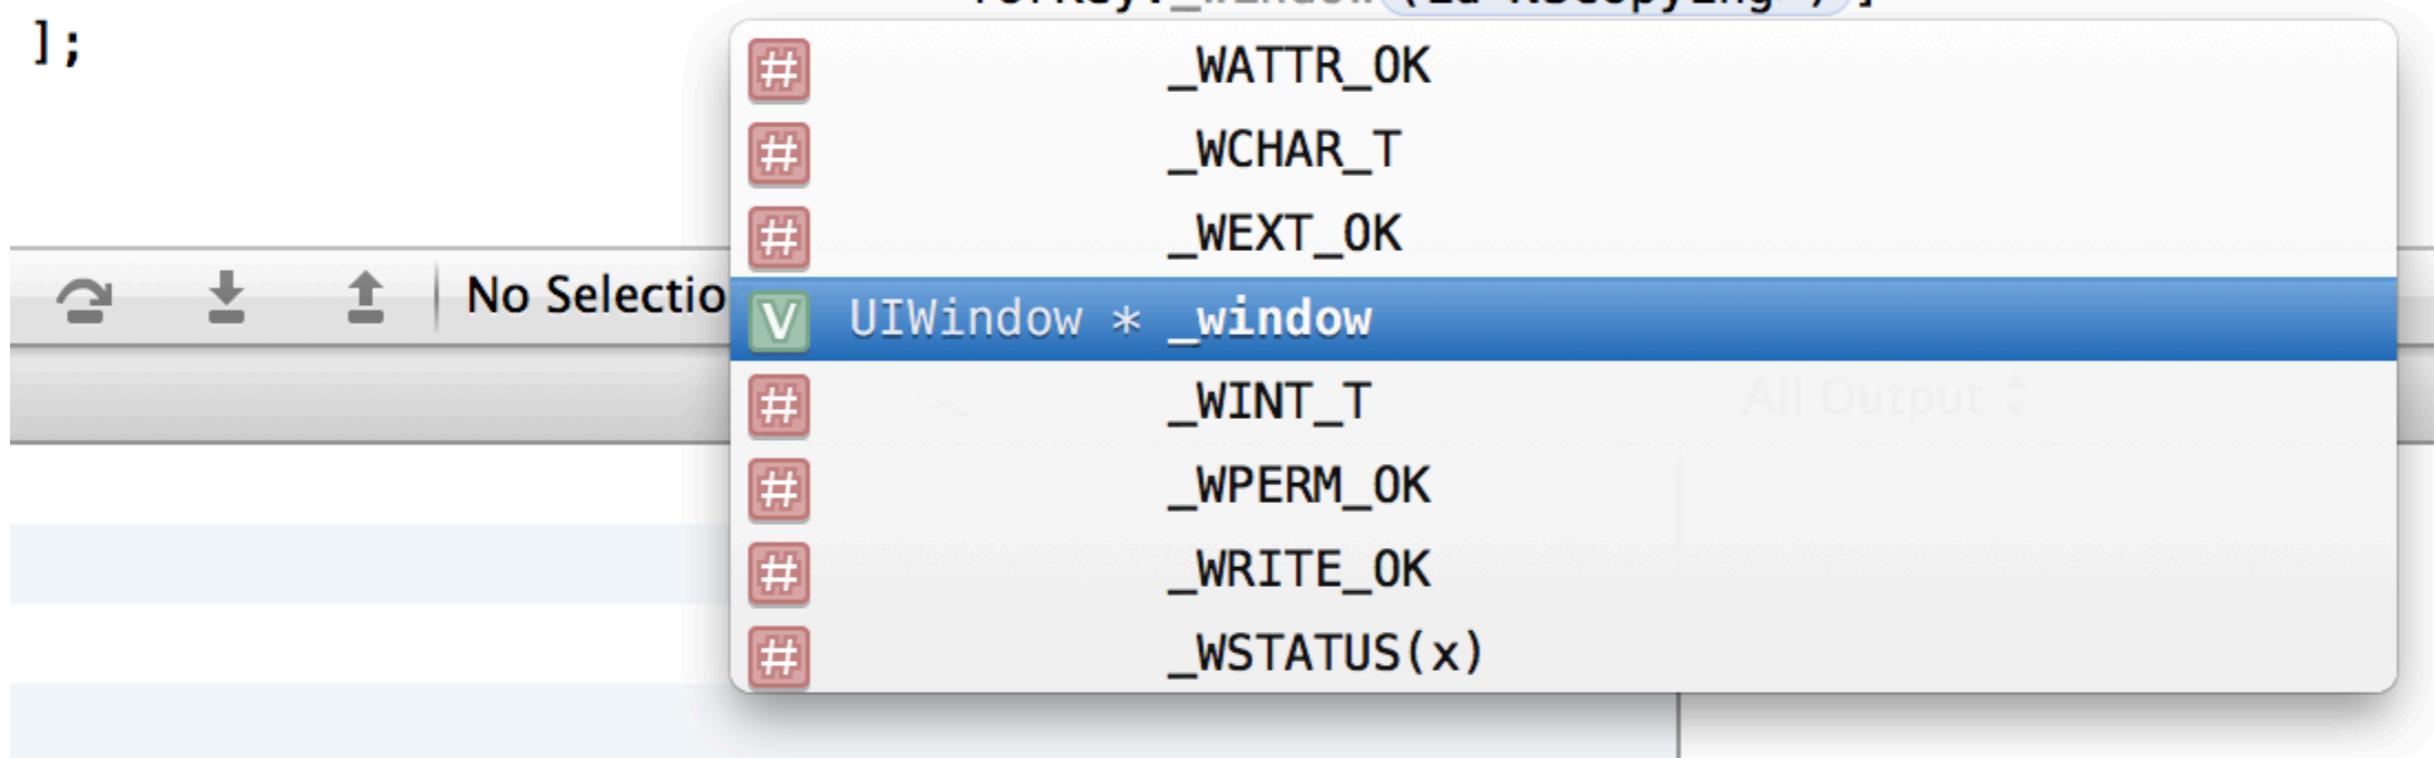

Code completion

```
CIContext *context = CIContext contextWithOptions:  
    [NSDictionary dictionaryWithObject: [NSNumber numberWithBool:YES]  
        forKey: (id<NSCopying>) ]  
];
```

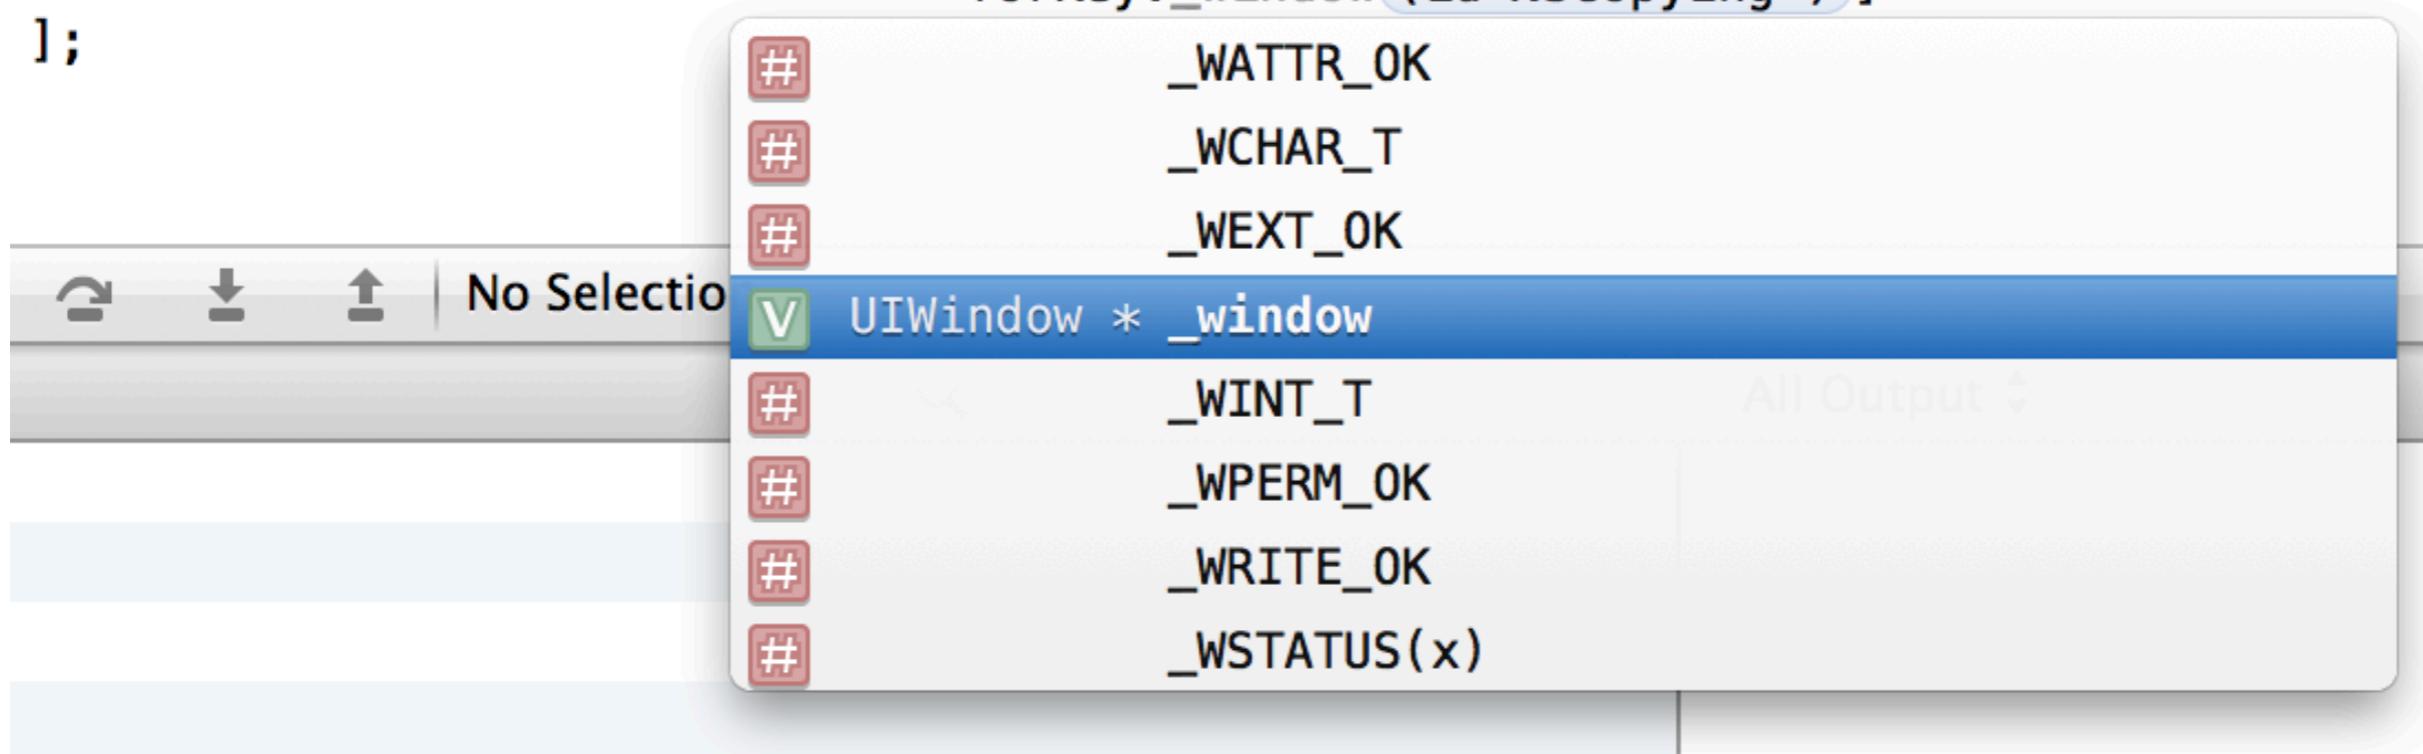

Code completion

```
CIContext *context = CIContext contextWithOptions:  
    [NSDictionary dictionaryWithObject:[NSNumber numberWithBool:YES]  
        forKey:_window(id<NSCopying>)]  
];
```

Code completion

```
CIContext *context = CIContext contextWithOptions:  
[NSDictionary dictionaryWithObject:[NSNumber numberWithBool:YES]  
    forKey:_window(id<NSCopying>)]  
];
```

```
var context = CIContext.FromOptions (new CIContextOptions () {
```

P OutputColorSpace

P UseSoftwareRenderer

P WorkingColorSpace

public bool UseSoftwareRenderer { get; set; }

Summary

Setting this to true will force the CPU software rendered to be used and prevent the job to be offloaded to the GPU

Debugging

```
▼ L views = (NSArray *) 0x0718e5b0 @"2 objects"
  ▼ [0] = (id) 0x07190170
    ▼ isa = (Class) UILabel
      ► isa = (Class) NSObject
  ▼ [1] = (id) 0x071919b0
    ► isa = (Class) UIRoundedRectButton
```

Debugging

▼ views		{MonoTouch.UIKit.UIView[2]}
► [0]		{<UILabel: 0xc0bf550; frame = (139 219; 42 21);}
▼ [1]		{<UIRoundedRectButton: 0xc0c0890; frame = (11
► C base		{MonoTouch.UIKit.UIControl}
P AdjustsImageWhenDisabled		true
P AdjustsImageWhenHighlighted		true
P ButtonType		RoundedRect
P ClassHandle		0x2f35c84
► P ContentEdgeInsets		{(0,0)(0,0)}
P CurrentAttributedTitle		(null)
P CurrentBackgroundImage		(null)
P CurrentImage		(null)
P CurrentTitle		🔍 "Button"
► P CurrentTitleColor		{UIColor [A=255, R=50, G=79, B=133]}
► P CurrentTitleShadowColor		{UIColor [A=255, R=127, G=127, B=127]}
P Font		{Helvetica-Bold 15}
► P ImageEdgeInsets		{(0,0)(0,0)}
► P ImageView		{<UIImageView: 0xc0d39d0; frame = (0 0; 0 0); cl

Design Philosophy

- Expose a direct binding to native APIs
 - Most of time 1:1 mapping
- Expose strong types, hide weak types
- Wrap "dictionary"-based APIs into strong types
- Maps Objective-C Delegate pattern to C# events

More fun stuff

Beautiful async

Blocking the UI is the root of all ~~evil~~ user frustration

Beautiful async

Blocking the UI is the root of all ~~evil~~ user frustration

```
void DownloadTweets ()  
{  
    FetchUrl (tweetUrl, result => {  
        tweetDb.Populate (ParseJsonResult (result), () => {  
            View.ReloadData ();  
        } );  
    } );  
}
```

```
void DownloadTweets ()
{
    FetchUrl (tweetUrl, result => {
        if (result == null)
            View.InvokeOnMainThread () => {
                ShowError ("Could not download tweets");
            });
        tweetDb.Populate (ParseJsonResult (result), (error) => {
            if (error) {
                Tweet.UpdateLastRead (lastValidCode, errorPost => {
                    if (errorPost != null)
                        View.InvokeOnMainThread () => {
                            ShowError ("Twitter is down");
                        });
                });
            } else {
                View.InvokeOnMainThread () => {
                    View.ReloadData ();
                    lastValidCode = currentCode;
                });
            }
        });
    });
}
```

C# 5 Async

```
async void DownloadTweets ()
{
    var tweets = await FetchUrl (tweetUrl);
    if (tweets == null) {
        ShowError ("Could not download tweets");
        return;
    }

    if (!await tweetDb.Populate (ParseJsonResult (result))) {
        if (!await Tweet.UpdateLastRead (lastValidCode))
            ShowError ("Twitter is down");
    } else {
        View.ReloadData ();
    }
}
```

Xamarin Test cloud

iOS and Android
Real devices!
Discovery mode

The screenshot shows the Xamarin Test Cloud web interface. At the top, there's a browser header with 'Xamarin Test Cloud' and the URL 'http://test.xamarin.com'. Below it is a navigation bar with 'My Apps', 'Employee Directory', the date 'April 16th, 2013, 2:33 AM', 'Upload New Test', and a user profile icon.

The main area has a search bar 'Filter tests...' and a summary section. It lists a single test case: 'Login button pressed in Login screen' with a status of '1 ⚡'. The test steps are:

- App Launched
- Entered "TestUser" into Username entry
- Entered "Password" into Password entry
- Pressed the Login button 1 ⚡
- Employees screen appeared.

Below this, there are sections for 'Ok button pressed in Need Help screen' (status green checkmark) and 'Xander text pressed in Employees screen' (status green checkmark).

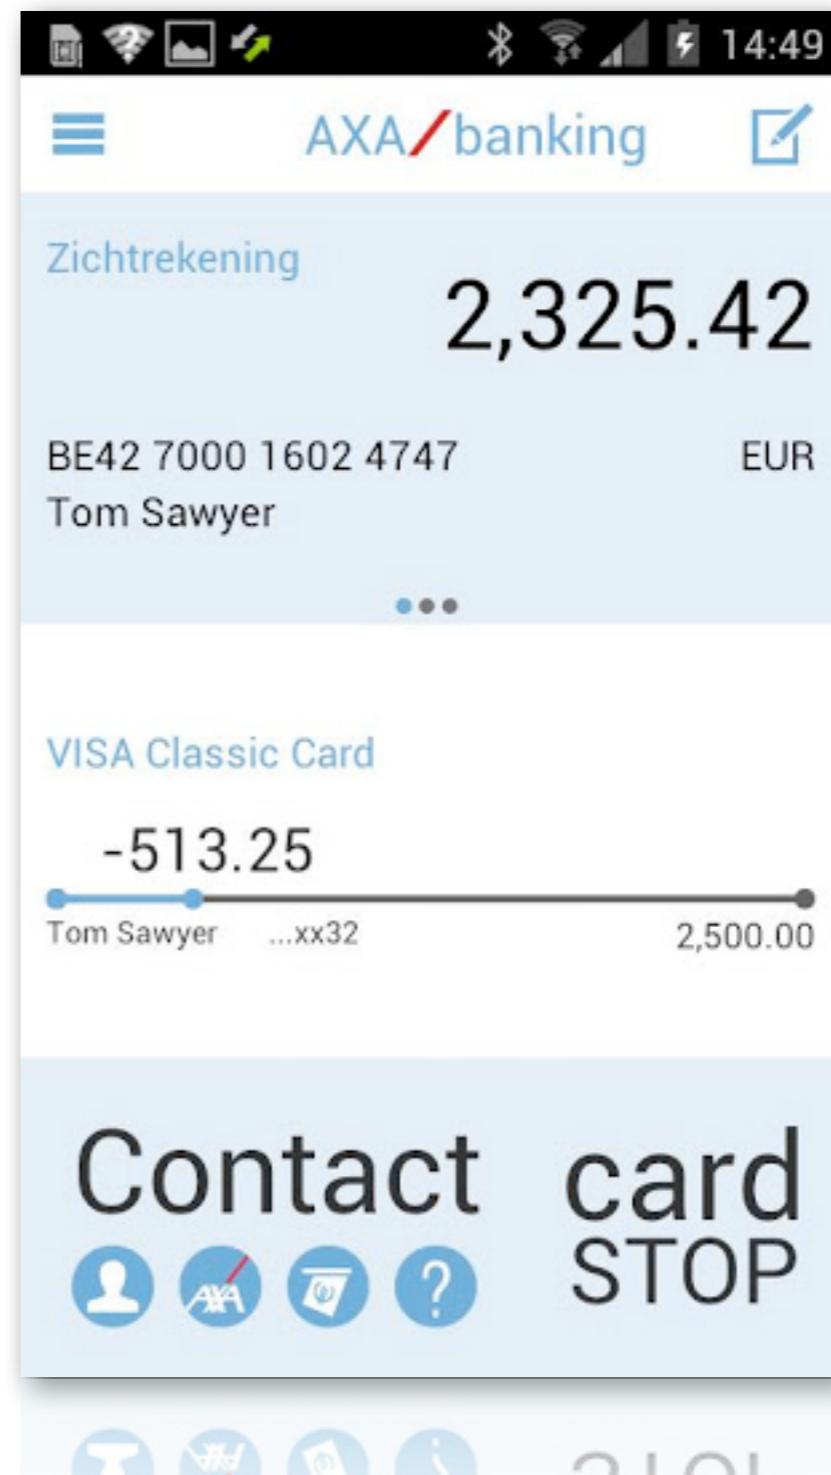

The central part of the interface is titled 'App Launched' and shows three screenshots of mobile phones (Samsung Galaxy S III, Samsung Galaxy S II, and Samsung Galaxy Note II) displaying the login screen of an app. Each phone has its own status indicator below it: 'Samsung Galaxy S III' (green checkmark), 'Samsung Galaxy S II' (green checkmark), and 'Samsung Galaxy Note II' (green checkmark).
